Junos MPLS Fundamentals (JMF) On-Demand

Junos MPLS Fundamentals (JMF) On-Demand

Course Overview

This 8-module ONLINE course provides students with a solid foundation on Multiprotocol Label Switching (MPLS). After introducing concepts such as LDP and the structure of the MPLS header, the course delves into the configuration and operation of the two main label distribution protocols, RSVP and LDP. It is given to the central topics of traffic engineering and MPLS traffic protection, including fast reroute, link/node protection, and LDP loop-free alternate. It is put into practice with a series of in-depth hands-on labs, which allow participants to gain experience in configuring and monitoring MPLS on Junos OS devices. Hands-on labs use Juniper Networks vMX Series devices using the Junos OS Release 16.1R3.10, but are also applicable to other MX Series devices.
